AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

1. (currently amended) A method for protecting a kidney in a mammalian patient from an insult caused by presence of a contrast agent in blood of the patient, the method comprising: at least partially occluding at least one renal vein of the patient; elevating a renal vein blood pressure during a period of high concentration of the contrast agent in the patient's blood, and reducing the renal vein blood pressure from the elevated blood pressure.

2. (cancelled).

- 3. (original) The method as in claim 1 wherein the elevated blood pressure inhibits a renal function.
- 4. (original) The method as in claim 3 wherein the inhibited renal function is a reduction in glomerular filtration rate (GFR).
- 5. (currently amended) The method as in claim 1 wherein the insult is a the presence of the contrast agent in the patient's blood and the contrast agent may subject the kidney to

radiocontrast nephropathy.

6. (original) The method as in claim 1 wherein partially occluding the renal vein is

accomplished by inserting a catheter tip with an inflatable balloon into the renal vein and

inflating the balloon.

7. (previously presented) The method as in claim 6 wherein the blood pressure is

maintained by sensing the renal vein pressure and adjusting the balloon in response to the

sensed renal vein pressure.

8. (currently amended) The method as in claim 2 6 further comprises lodging the catheter

in a branch of the renal vein distal of the balloon.

9. (original) The method as in claim 1 further comprising injecting the contrast agent into

a blood vessel of the patient.

10. (previously presented) The method as in claim 2 wherein the period of high

concentration of contrast in blood occurs from injection of the contrast into a blood vessel

until a fifty percent reduction in the concentration of contrast in blood from a peak

contrast concentration.

11. (original) The method as in claim 1 wherein the renal vein blood pressure is elevated

to a range of 30 to 60 mmHg.

LE-217J

Response OA 6-03-08

TET/cae

3

12. (previously presented) The method as in claim 1 wherein the renal vein pressure is

elevated to a range of 30 to 60 mmHg above a baseline renal vein pressure of the patient.

13. (original) The method as in claim 3 wherein a balloon size is adjusted based on a

sensed renal vein pressure.

14. (currently amended) A method for minimizing radiocontrast nephropathy in a

mammalian patient caused by presence of a contrast agent in blood of the patient, the

method comprising: at least partially occluding at least one renal vein of the patient, and

elevating a renal vein blood pressure during a period of high concentration of the contrast

agent in the blood of the patient coinciding with an injection of contrast in blood of the

patient.

15. (cancelled)

16. (original) The method as in claim 14 wherein the elevated blood pressure inhibits a

renal function.

17. (original) The method as in claim 16 wherein the inhibited renal function is a

reduction in glomerular filtration rate (GFR).

18. (original) The method as in claim 14 wherein the renal pressure is elevated prior to

4

the injection of the contrast agent.

LE-217J

Response OA 6-03-08

19. (original) The method as in claim 14 wherein partially occluding the renal vein is

accomplished by inserting an expandable catheter tip.

20. (original) The method as in claim 19 wherein the catheter tip further comprises an

inflatable balloon, which is inflated after being positioned in the renal vein.

21. (previously presented) The method as in claim 20 wherein the blood pressure is

maintained by sensing the renal vein pressure and adjusting the balloon in response to the

sensed renal vein pressure.

22. (original) The method as in claim 19 further comprises lodging the catheter tip in a

branch of the renal vein distal of the balloon.

23. (original) The method as in claim 14 further comprising injecting the contrast agent

into a blood vessel of the patient.

24. (currently amended) The method as in claim 23 further wherein the period of high

concentration of contrast agent in the blood occurs from injection of the contrast into a

blood vessel until to a fifty percent reduction in the concentration of the contrast in the

blood from a peak contrast concentration.

25. (original) The method as in claim 14 wherein the renal vein blood pressure is elevated

to a range of 30 to 60 mmHg.

26. (previously presented) The method as in claim 14 wherein the renal vein pressure is

elevated to a range of 30 to 60 mmHg above a baseline renal vein pressure of the patient.

27. (original) The method as in claim 20 wherein a balloon size is adjusted based on a

sensed renal vein pressure.

28. (withdrawn) The system for treating radiocontrast nephropathy in a mammalian

patient comprising: a renal catheter further comprising a distal tip section having a renal

vein occlusion device and a renal vein pressure detector, and a proximal section external

of the patient when the distal tip section is positioned in a renal vein, and an actuator for

the renal vein occlusion device and connectable to the proximal section of the renal

catheter, wherein said actuator controls the renal vein occlusion device.

29. (withdrawn) The system as in claim 28 further comprising a controller for the

actuator wherein said controller monitors the renal vein pressure based on signals from

the pressure detector and actuates the occlusion device in response to the renal vein

pressure

30. (withdrawn) The system as in claim 28 wherein the occlusion device is an

6

expandable device at a distal section of the catheter.

LE-217J Response OA 6-03-08

TET/cae

31. (withdrawn) The system as in claim 30 wherein the expandable device is

positionable in a renal artery leading to the at least one kidney.

32. (withdrawn) The system for artificially protecting a kidney during a renal insult in a

mammalian patient comprising: means for at least partially occluding at least one renal

vein of the patient, and means for controlling an increase in renal vein blood pressure

during a period corresponding to the insult.

33. (withdrawn) The system as in claim 32 wherein the renal insult is a radiocontrast

infusion and the period corresponding to the insult is a period of high concentration of

contrast in blood of the patient.

34. (withdrawn) The system as in claim 32 wherein the renal insult is a surgical

procedure.

35. (withdrawn) The system as in claim 32 wherein the renal insult is a hypotension.

36. (withdrawn) The system as in claim 32 wherein the means for at least partially

occluding further comprises a catheter having an expandable device at a distal section of

the catheter.

37. (withdrawn) The system as in claim 36 wherein the expandable device is

positionable in a renal artery of the at least one kidney.

LE-217J Response OA 6-03-08

TET/cae

7

38. (withdrawn) The system for artificially protecting a kidney during a renal insult in a

mammalian patient comprising: a renal catheter further comprising a distal tip section

having a renal vein occlusion device and a renal vein pressure detector, and a proximal

section external of the patient when the distal tip section is positioned in a renal vein, and

an actuator for the renal vein occlusion device and connectable to the proximal section of

the renal catheter, wherein said actuator controls the renal vein occlusion device.

39. (withdrawn) The system as in claim 38 further comprising a controller for the

actuator wherein said controller monitors the renal vein pressure based on signals from

the pressure detector and actuates the occlusion device in response to the renal vein

pressure

40. (withdrawn) The system as in claim 38 wherein the occlusion device is an

expandable device at a distal section of the catheter.

41. (withdrawn) The system as in claim 38 wherein the expandable device is

positionable in a renal artery leading to the at least one kidney.

42. (withdrawn) The system as in claim 38 wherein the renal insult is a radiocontrast

infusion.

43. (withdrawn) The system as in claim 38 wherein the renal insult is a surgical

LE-217J

procedure.

44. (withdrawn) The system as in claim 38 wherein the renal insult is a hypotension.

45. (withdrawn) The system as in claim 38 wherein the means for at least partially

occluding further comprises a catheter having an expandable device at a distal section of

the catheter.

46. (withdrawn) The system as in claim 45 wherein the expandable device is

positionable in a renal artery of the at least one kidney.
